
1
Ideation
V variants of a leader
(team, GenAI)
2
Pre-screening
rough score of every
unbuilt idea
(validity ρ)
3
Build & deploy
best-screened idea
behind a feature flag
4
Online test
traffic slice of n
sessions per test
5
Telemetry
conversion,
p95 latency,
errors, metered cost
6
Evidence ledger
belief M_k^p
and evidence
count of every variant
7
Re-test plan
leaders +
one rotating
variant in next round
8
Ship decision
lower bound $M - \kappa s$
continue /
ship / reframe
test result
$y = U + b + \varepsilon$
re-tests of the leaders and of one rotating variant
next round
(continue)
