(a) Emulator vs analytic model
utility measured in the emulator
(one experiment, 6,000 sessions)
utility from the analytic model (steady state)
stable ($\rho_{\max} < 0.85$)
near capacity ($0.85 \le \rho_{\max} < 0.97$)
over capacity ($\rho_{\max} \ge 0.97$)
(b) Noise of a test
s.d. of a test result σ
sessions per test n
emulator (20 replications)
statistical test sampler
$\propto n^{-1/2}$
