
1
Ideation
V variants of a leader
(team, GenAI)
2
Pre-screening
rough score of every
unbuilt idea
(validity ρ)
3
Build & deploy
three best-screened
ideas behind flags
4
Online test
traffic slice of n
sessions per test
5
Telemetry
conversion,
p95 latency,
errors, metered cost
6
Evidence ledger
belief M_k^p
and evidence
count of every variant
7
Re-test plan
two leaders re-tested
in the next round
8
Ship decision
lower bound $M - \kappa s$
continue /
ship / reframe
next round
(continue)
re-tests of the two leading variants
test result
$y = U + b + \varepsilon$
